Object Fit, Position, and View Box

This demo combines all `object-fit` modes with keyword, percentage, and four-value `object-position` placements. The last row also shows `object-view-box` crops using the three rectangle syntaxes.

`object-view-box` is only exposed by Chromium-class browsers today. The demo still loads elsewhere, but those cards will fall back to the uncropped image when the browser does not support the property.

Fill

`object-fit: fill`

Stretches the source to the frame.

None + Four-Value Offset

`object-fit: none`

`object-position: right 18px bottom 12px`

Contain + Keywords

`object-fit: contain`

`object-position: left top`

Cover + Percentages

`object-fit: cover`

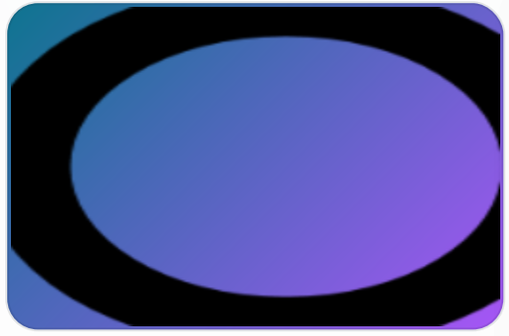

`object-position: 18% 78%`

Scale-Down + Offset

`object-fit: scale-down`

`object-position: right 12px bottom 10px`

View Box via `inset()`

Crops the intrinsic image before fitting it into the frame.

View Box via `xywh()`

Uses an explicit source rectangle and then applies cover cropping.

View Box via `rect()`

Demonstrates the top/right/bottom/left rectangle form.
