

# Line Clamp Values

These cards cover the legacy `-webkit-line-clamp` flow, the modern unprefixed `line-clamp` property, the `no-ellipsis` modifier, and an unclamped control. Browsers that do not support the modern values will simply render those cards without truncation.

LEGACY ONE-LINE CLAMP

A single-line clamp should still append an ellipsis when the copy runs far beyond the width of the card and the browser clips the extra content.

`display: -webkit-box`  
`-webkit-line-clamp: 1`

LEGACY TWO-LINE CLAMP

This two-line example mirrors the pattern used by feed cards, search results, and social media posts.

`-webkit-line-clamp: 2`  
No explicit `text-overflow` declaration.

LEGACY THREE-LINE CLAMP

Longer editorial text often wants one more line of headroom before the truncation kicks in, especially for longer paragraphs.

`-webkit-line-clamp: 3`

MODERN TWO-LINE CLAMP

The modern shorthand expresses the same intent as the legacy property.

`line-clamp: 2`

MODERN NO-ELLIPSIS

Some components need the visible text to be fully visible, even if it means truncating the line.

`line-clamp: 2 no-ellipsis`

UNCLAMPED CONTROL

This card uses the same copy as the others, but without any line clamping.

`line-clamp: none`
